Industry partner prototype feedback

COS30031 Games Programming | Swinburne University of Technology

Please complete one form per team after watching its 2D prototype showcase and send it back to us by Friday 23 October. Your feedback will help students improve their final 3D game. Type in the response areas; they will expand as needed.

Review of the prototype

Enter one rating per row**: Strong / Developing / Needs attention / Not shown**. Judge only what the video demonstrates. These ratings guide development and are not academic marks.

Criterion	Rating
Detects, validates, prioritises and remediates zero-day risk	Strong
Accurate Qualys concepts, clear without prior product knowledge	Strong
Clear game goal and understandable player actions	Developing
Engaging gameplay and useful player feedback	Developing
Readable presentation and consideration of accessibility	Strong

What should the team keep

Identify the strongest idea or feature. Give an example or video timestamp where useful.

Keep the concept of protecting the perimeter or the “firewall” for example. You can leverage other defense items such as Proxies and Web Application Firewalls as other defense components to the wall. If there is a concept of adding additional defense to a certain wall/side. Overall, very great ideas and concepts. The strongest feature is keeping the player engaged in protecting the stronghold. The variety of options for physics is a nice addition. Keep the health of the player and allow the walls to be broken and defeated or hacked/exploited/exposed. Leveraging InstaScan is great showcase of Qualys’s powerhouse of Agentic AI agents' power which can detect vulnerabilities in minutes. Would add additional threat graphics to show the difference between different types of threats. Some of the animations are difficult to see in the video, as you mentioned, but I figured that would sharpen up when switching to 3D. Sound effects make or break the experience.

Priorities for the final 3D game

List up to three changes in priority order. Include any factual corrections or essential brief requirements. Focus on changes achievable before the final submission.

1. Add a variety of Threat sprites to showcase the variety of attacks that can happen on a network/company.
2. Add additional options to add defense if successfully defending the wall such as turrets or stronger wall materials or thickness.
3. Add a progression bar to show how far from victory the player is while defending the wall, and add additional animations where possible

Advice for moving from 2D to 3D

[What should carry over or change in 3D? Note any audience, accessibility or content concerns, or a question the team should resolve.]

When going from 2D to 3D, I would ensure the player can see over the wall or potentially use turrets to fire from. The monsters could change per level, and get stronger looking, and carry a variety of animations to reflect the various types of attacks (XSS, Command Injection, SQLi, Path Traversal, etc.). You could add tags to each monster reflecting the attack as well, to highlight criticality. Some monsters should hurt the wall more than others, and players should be rewarded higher for these encounters. This will help showcase prioritizing the attacks that mean the most.

Any other comments

[Add any other comments or suggestions here]

Overall, great concepts, great research, and great execution. It makes it easy for someone with little knowledge of cybersecurity and helps fast track them to a basic understanding. The gameplay seems very engaging and will keep the players attention easily. Great work!

Return this form to Dr Atie Kia at akia@swin.edu.au. Feedback will be shared with the team through the teaching staff. Please avoid including confidential information.
